

Fixed Cellular Terminals for Remote Communications

Telular's Fixed Cellular Terminals Enable Voice, Data and Fax Capabilities Where None Previously Existed

The Challenge: Data, voice and fax communications in remote locations where landline connectivity is inaccessible.

Today, basic communication services are taken for granted. Ubiquitous access to high-speed data, voice, fax and Internet is a requirement for increased productivity, efficiency and security. But, there are remote locations where these services are not available. Depending on the terrain, traditional landline infrastructure remains very costly and challenging to install. Temporary communications in isolated locations, such as, boats, commercial fishing vessels or new construction sites, can also be cost-prohibitive and physically or geographically impossible.

The Solution: Telular's SX7 Fixed Cellular Terminals

Telular's SX7 fixed-cellular terminals for 3G networks, bridge or extend the physical range of analog to digital communications without the need to disrupt, replace or invest heavily in new network infrastructure. These units provide a cost-effective and robust alternative to traditional wireline services, making them ideal for remote communications. By leveraging Telular's RJ-11-to-cellular interface technologies, the SX7 enables instant, high-quality voice, wireless broadband and fax services over a single wireless network.

LOSE THE LINE. KEEP THE CONNECTION.

Designed for Ease-of-Use

The SX7 can be set up quickly and easily by a non-technical person, providing dial tone service within minutes. With multiple standard connections, it allows a variety of office equipment to leverage today's cellular networks. Computers, Wi-Fi access points or similar devices can be enabled through the unit's Ethernet or USB port. Phone and fax* access is available by plugging into one of two RJ-11 ports. A SIM card can be purchased from a carrier for the GSM model and inserted for immediate use. The CDMA model is activated by contacting the carrier directly, just like typical cell phone activation.**

The SX7 series has a powerful and sensitive antenna, which allows the unit to connect with networks in areas a typical mobile device cannot. This feature extends connectivity to the farthest fringes of the network and into rural areas. Furthermore, by using a standard telephone, voice quality improves when compared to cell phone handsets.

"Day One" Construction Site Connectivity

Many new home construction sites are miles from the closest landline connection point. As a result, phone and fax services in those locations can be very costly for home builders to install.

In addition to accessing a network connection for basic communications, the exchange of time-sensitive documents is essential to the operation of construction sites. Equipment orders, contracts and floor plans require that both phone and fax lines be available before a new job can start.

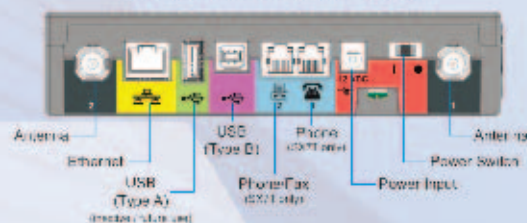

The SX7 provides home builders with access to phone and fax connectivity at new home construction sites without the expense or administrative work associated with landline service. In addition, because the SX7 is portable it can be re-used at the next location immediately after the current site is complete.

Offshore Networks on Boats, Yachts and Other Water Vessels

Access to maps, real-time weather reports or simply being able to connect with people on land is extremely important in the open seas where dangerous conditions can suddenly arise. Many types of water vessels (cruise ships, tug boats, commercial fishing vessels) function as businesses that need "office" connectivity. Reliable network access for numerous communication devices is vital to business continuity and increased productivity in these offshore offices.

With the SX7 allowing access to the nearest cellular connection, crewmembers and guests are instantly connected to the services they need in order to be productive. The terminals are small and can be installed on a desk or wall, which makes them convenient for watercraft of all sizes.
